

Public health management of persons, including health care workers, having had contact with COVID-19 cases in the European Union

25 February 2020

Background

The rapidly evolving epidemiological situation with the novel coronavirus disease 2019 (COVID-19) epidemic is prompting EU Member States to review not only case management but also how to deal with people who have been in contact with newly detected cases ('contacts'). This document can be read together with WHO's guidance '[Home care for patients with suspected novel coronavirus \(2019-nCoV\) infection presenting with mild symptoms and management of contacts](#)' [1].

Scope of this document

This document aims to provide guidance for EU/EEA public health authorities on the management of persons, including healthcare workers, having had contact with COVID-19 cases.

Target audience

Public health professionals and healthcare practitioners in EU/EEA Member States.

Purpose of contact management

The purpose of managing COVID-19 case contacts is:

- to identify symptomatic contacts as early as possible for isolation and treatment, and
- to facilitate prompt laboratory diagnostic testing.

Definition of contact persons

A contact of a COVID-19 case is a person not currently presenting symptoms, who has or may have been in contact with a COVID-19 case. The associated risk of infection depends on the level of exposure which will, in turn, determine the type of monitoring. Establishing the level of exposure can be difficult and requires the case to be interviewed.

1. High-risk exposure (Close contacts*)

- a person living in the same household as a COVID-19 case;
- a person having had direct physical contact with a COVID-19 case (e.g. handshaking);
- a person having unprotected direct contact with infectious secretions of a COVID-19 case (e.g. being coughed on, touching used tissues with a bare hand);
- a person having had face-to-face contact with a COVID-19 case within 2 m [2] and > 15 min;
- a person who was in a closed environment (e.g. classroom, meeting room, hospital waiting room, etc.) with a COVID-19 case for 15 minutes or more and at a distance of less than 2 meters;
- a healthcare worker (HCW) or other person providing direct care for a COVID-19 case, or laboratory workers handling specimens from a COVID-19 case without recommended PPE or with a possible breach of PPE [3];
- a contact in an aircraft sitting within two seats (in any direction) of the COVID-19 case, travel companions or persons providing care, and crew members serving in the section of the aircraft where the index case was seated [4] (if severity of symptoms or movement of the case indicate more extensive exposure, passengers seated in the entire section or all passengers on the aircraft may be considered close contacts);

2. Low-risk exposure (casual contact)

- person who was in a closed environment with a COVID-19 case for less than 15 min or at a distance of more than 2 meters;
- a person having had face-to-face contact with a COVID-19 case for less than 15 min and at a distance of less than 2 meters;
- traveling together with COVID-19 case in any kind of conveyance.

Longer duration of contact increases the risk of transmission; the 15 min limit is arbitrarily selected for practical purposes. Public health authorities may consider expanding contact tracing and management to persons with shorter duration of contact with a case based on individual risk assessment.

Healthcare workers

Healthcare workers caring for COVID-19 patients in EU/EEA hospitals should be registered and monitored in accordance with the occupational health procedures/routines in their country of practice. Based on the high risk of healthcare-associated transmission and in line with existing recommendations from other institutions [10], following specific measures are proposed for HCWs:

Unprotected contact (high risk exposure):

- active monitoring for 14 days AND
- exclude from work for 14 days after last exposure

Protected contact wearing recommended PPE:

- self-monitoring and self-isolation should respiratory symptoms are experienced
- no exclusion from work

Contact management steps after a case is identified

Immediately after a case is confirmed, the next steps are:

- contact identification and listing, and classification of the contact as having had high-risk exposure ('close contact') or low-risk exposure;

* Adapted from Global Surveillance for human infection with coronavirus disease (COVID-2019) - Interim guidance. Available from: [https://www.who.int/publications-detail/global-surveillance-for-human-infection-with-novel-coronavirus-\(2019-ncov\)](https://www.who.int/publications-detail/global-surveillance-for-human-infection-with-novel-coronavirus-(2019-ncov))

- contact tracing and assessment (i.e. communicate with contact persons and assess risk);
- contact management and follow-up (i.e. inform, advise, follow-up - this includes testing if indicated);
- follow-up of contact tracing results by an outbreak control team.

Monitoring of contacts

Figure 1 describes the monitoring of contacts and the actions to take.

Depending on the specific situation, public health authorities can support, promote or implement further restrictions (e.g. voluntary limitation of contacts by the person, or avoiding contact with crowds) [5].

Contact tracing and management are based on the latest available knowledge, as below.

- Current estimates suggest a median incubation period from five to six days, with a range of up to 14 days. A recent modelling study confirmed that it remains prudent to consider the incubation period of at least 14 days [6,7].
- A case is believed to be most infectious when symptoms are present, but could possibly already be infectious before the onset of symptoms.
- Transmission is believed to be mainly via respiratory droplets. At present, it is still unclear whether airborne or faecal transmission is possible.
- Additional measures for healthcare workers are suggested based on existing evidence of frequent healthcare-associated (or 'nosocomial') transmission. In a series of 138 cases from Zhongnan Hospital in Wuhan, hospital-associated transmission was suspected for 40 (29%) healthcare workers and 17 (12.3%) hospitalised patients [9].

Main actions for contact persons

Contacts with high-risk exposure:

- active monitoring by public health authorities, for 14 days from last exposure;
- daily monitoring for COVID-19 symptoms, including fever of any grade, cough or difficulty breathing;
- avoid social contact;
- avoid travel;
- remain reachable for active monitoring.

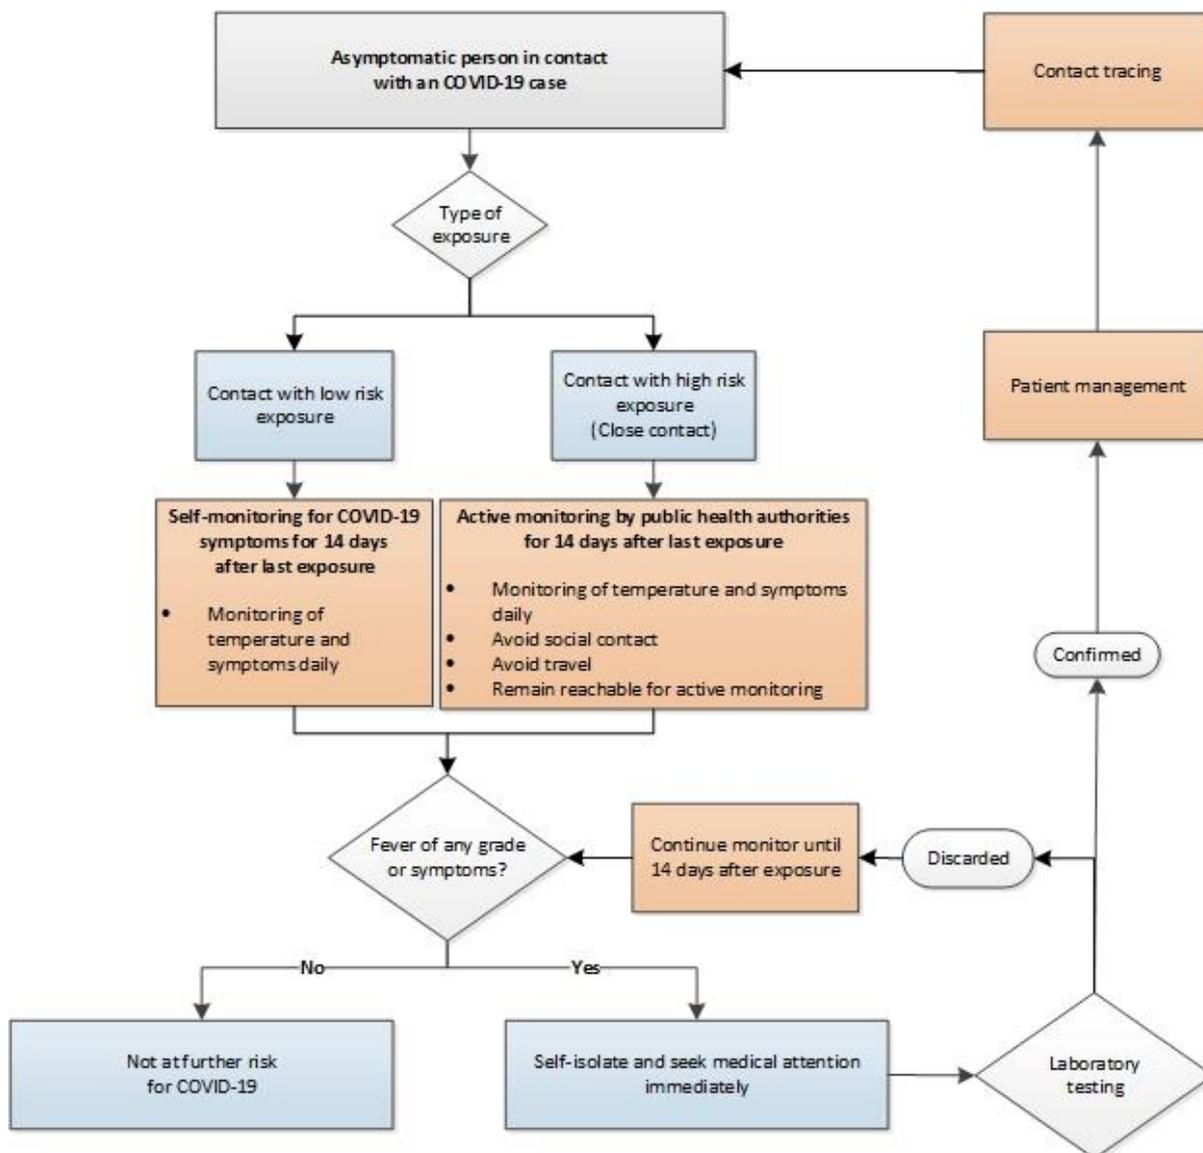

Contacts with low-risk exposure:

- self-monitoring for COVID-19 symptoms, including fever of any grade, cough or difficulty breathing, for 14 days from last exposure;
- public health authorities may do more, depending on the specific situation.

Contacts, irrespectively of whether their exposure was high-risk or low-risk should immediately self-isolate and contact health services in the event of any symptom appearing within 14 days of last exposure. If no symptoms appear within 14 days of last exposure the contact person is no longer considered to be at risk of developing COVID-19 disease.

Implementation may be modified depending on the risk assessment for individual cases and their contacts by public health authorities.
